

## iVendi Case Study

### Training and Incident Response Exercising

As a SaaS provider in the highly competitive automotive industry, our clients expect uptime and data security as standard and we take this responsibility extremely seriously.

Since our inception in 2009 we have grown to over 120 people and our products and services has developed year on year. As such, we've always had to invest heavily in cyber security.

With high profile names like M+S and Co-op falling foul of cyberattacks despite having huge security budgets, we recognised that part of our focus had to be on our response strategy. We wanted to simulate what would happen if we ever fell victim to a successful attack as a learning exercise for everyone in our business.

Validating our own processes like this is crucial to giving us the confidence we need to grow at home and internationally and Secarma's Incident Exercising training proved the perfect tool for this need.

The service managed to weave table-top exercising with training material to help us to workshop our response at the same time as educating us on ways to improve the process. I would highly recommend it to other system and data reliant businesses.

The assessor was knowledgeable and the process suitably rigorous. We all came away from the session with increased knowledge and an appreciation of the areas that most need further development.

We're confident that Secarma will be able to provide training towards all of these areas to give us further cybersecurity confidence.
